Circuit Breaker Model Update HEA 1001 (2008) January 2009 Computations

This document explains differences between the March 2008 LSA circuit breaker model and the January 2009 model.

The items in this section affect all counties.

1. AV Data. This model uses updated auditor and assessor real and personal property data. (See Chart below.)

2. Personal Property. Personal property billing data from the county auditor is used in the model on a per-return basis. The previous model used taxing district totals from the auditor's abstract because of data quality issues.

3. AV by Property Type. Each parcel is broken down into its component AV parts, based on circuit breaker cap type. For example, the AV on an agricultural parcel might be split into homestead AV, farmland AV, and other real property AV. Each part is processed through the model separately. In the previous model, each parcel was kept whole. If the parcel contained a homestead, then the entire parcel was deemed a homestead for circuit breaker cap purposes.

4. Trended Values. The growth rate assumptions used in this model are based on the Global Insight home price index that provides a regional growth rate by metropolitan statistical area (MSA). This index employs up-to-date economic factors to estimate home value growth. The previous model used statewide estimated growth rates based on the Freddie Mac Home Price Index, Indiana and the NIPA (GDP data) price deflator for non-residential structures (US).

This model also specifically identifies farmland and applies a growth rate equal to the annual change in the DLGF's base rate for farmland. In the previous model, the non-residential growth factor was applied to farmland.

5. Levy Base. This model uses 2008 levies for 88 counties and 2007 levies for 4 counties as a base for levy projections. The previous model relied on 2007 data for 89 counties and 2006 data for 3 counties. There were many unanticipated changes in the 2008 levies, namely new or expired debt levies and general levy reductions in some taxing units. (See Chart below.)

6. Levy Growth. The growth rates for levies were updated for this model.

A. Levy-controlled funds grow at the rate of the income-based assessed value growth quotient (AVGQ). The personal income estimates used to determine this quotient have been updated, leading to growth rates of 4.0% in 2009, 3.6% in 2010, and 3.3% in 2011. The previous model used growth rates of 4.3% in 2009 and 4.6% in 2010. No estimate was made for 2011 in the previous model.

B. The growth for cumulative fund levies, including the school capital projects fund, is tied to the change in net assessed value. The additional standard deduction and the new supplemental standard deduction will reduce net AV for taxes payable in 2009. This will translate to a reduction in the levy for these funds. The previous model held cumulative fund levies steady.

C. This model makes a one-time adjustment to county levies in 2009 to account for any year-end cash surpluses or deficits in the 2008 county family and children's fund. Levies were reduced in 76 counties by a total of \$98 M and levies were increased in 15 counties by a total of almost \$7 M. This adjustment was not made in the previous model.

D. This model redistributes the available CAGIT PTRC amount among the remaining levies after several levies were eliminated. This reduces the remaining levies in CAGIT counties. The previous model did not make this reallocation.

7. Local COIT and CEDIT Homestead Credits. In this model, the existing COIT-funded HSC rates were applied to each homestead's calculated gross tax. For the CEDIT-funded credit, the total proceeds generated from the CEDIT tax rate adopted to provide homestead credits is reallocated among homesteads in the county, pro rata based on the gross tax. The previous model used the existing credit rate for both the COIT and CEDIT credits.

8. Tax Increment Financing. This model identifies the amount of the estimated circuit breaker credits that are attributable to TIF allocations. The previous model reported these as a part of the credits assigned to all of the taxing units in the district.

The following changes affect specific counties.

1. Brown, Clark, and Posey County Levies. The previous model used 2006 levies as a base for these three counties. A programming issue specific to these three counties resulted in an underestimate of the county unit levies. This has been corrected in the current model.

2. Lake and St. Joseph Debt Exclusion. This model uses updated factors to eliminate old debt from the net tax amount compared to the circuit breaker cap. The factors used in the previous model did not exclude enough of the levy in some taxing districts.

3. Marion County Trended AV Data. Marion County was ordered to re-trend their Pay 2007 real property values. The re-trending was completed in the latter part of 2008. The previous model used the original trended values whereas the updated model uses the re-trended values.

4. Carroll, Fulton, Huntington, Miami, and Steuben County LOIT. These five counties enacted a local option income tax that, beginning in 2009, would either freeze controlled levies, provide direct taxpayer credits, or both. This model incorporates these changes.
